

ExternalDNS - What problem does it solve?

Stop hand-editing DNS records.

The manual way

1. Deploy a Service / Ingress
2. Copy the load balancer hostname
3. Log into your DNS provider's dashboard
4. Create the CNAME record by hand
5. Repeat for every app...
6. ...and again on every change

Slow • error-prone • doesn't scale

The ExternalDNS way

Declare the hostname once,
right in your Ingress rule.

A controller keeps your DNS
provider in sync — automatically:
