

CNAME + TXT (ownership)

ExternalDNS manages two records

① CNAME — the actual route

```
shop.example.com  
CNAME → *.elb.amazonaws.com
```

Points your friendly hostname at the AWS load balancer. This is the record users' browsers resolve.

② TXT — the ownership tag

```
a-shop.example.com  
TXT → heritage=external-dns,  
      owner-id=eks-cluster
```

ExternalDNS's registry record. It marks which records it owns — so it only ever touches its own. Remember this one — the loop relies on it.
